Cotton Varieties Planted, United States
1961-1965

Estimates of the percentages of the various varieties of cotton planted in the United States in 1965, by counties, districts and states, are presented in this report. Comparative variety data for the four years 1961-1964 are shown by districts and states. A preliminary report containing percentage distributions of cotton varieties planted by counties and districts in the early harvesting area of south Texas was published in mid-June.

The variety data presented herein are based principally on estimates furnished by cotton ginner for the territories served by their gins. Supplemental information is obtained from others closely associated with cotton culture in their respective areas, such as seed breeders and dealers, and county agents.

Four general varieties account for nearly two-thirds of the cotton acreage planted in the United States this year. These varieties in order of their relative importance are Deltapine, Stoneville, Acala and Lankart. A percentage distribution of the ten leading general varieties planted in 1965, with comparisons for four previous years is shown at the foot of this page. All strains of each particular variety are combined for the purpose of this comparison.

Deltapine remains the leading variety of cotton planted in the United States for the sixth consecutive year. About 22 percent of total 1965 acreage was planted to Deltapine compared with 25 percent of the total in each of the three preceding years. Deltapine is the principal variety planted in Arizona, Kentucky, Louisiana, Mississippi and Tennessee. DPL Smooth Leaf, a Deltapine strain, accounts for 20 percent of the total United States cotton acreage this year.

Stoneville moved into second place among the leading varieties planted this year. Estimates indicate that this variety accounts for 18 percent of total acreage, up substantially from last year's 13 percent. Stoneville is the leading variety in Arkansas, Illinois and Missouri, and is the second leading variety planted in Louisiana, Mississippi and Texas.

Acala dropped to third among the leading varieties of cotton planted this year with 14 percent of the total acreage against 13 percent last year. Acala is the principal variety planted in California, Nevada, New Mexico and District 6 of Texas.

Lankart continues as the fourth leading variety planted this year. The acreage planted to Lankart is estimated at 11 percent of the total, unchanged from a year earlier. Lankart is the leading variety planted in Oklahoma and Texas, accounting for 59 and 36 percent, respectively, of total acreage planted in these states.

Carolina Queen continues to grow in importance and this year accounts for seven percent of total cotton acreage compared with four percent a year earlier. This is the leading variety planted in the major cotton-producing states of the southeastern area of the belt with the exception of Alabama where it is second in importance. Carolina Queen accounts for 65 percent of this year's acreage in South Carolina and comprises 43 percent of total southeastern acreage.

Other leading varieties planted this season are Coker, Dixie King, Gregg, Paymaster and Rex. Coker ranks second among the more prominent varieties planted in the southeastern states. Dixie King is the predominant variety in Alabama and is the second most popular variety in Tennessee. Gregg and Paymaster are rather popular varieties in some parts of the southwestern area of the belt. Rex is planted to a substantial acreage this year in a number of sections in the eastern half of the belt. Pima S-2 remains the leading variety of American-Egyptian cotton representing about 78 percent of extra long staple acreage in the United States this year.

The variety data presented in this report are estimates which should serve as reliable guides as to the geographic distribution of the various varieties of cotton throughout the Cotton Belt.

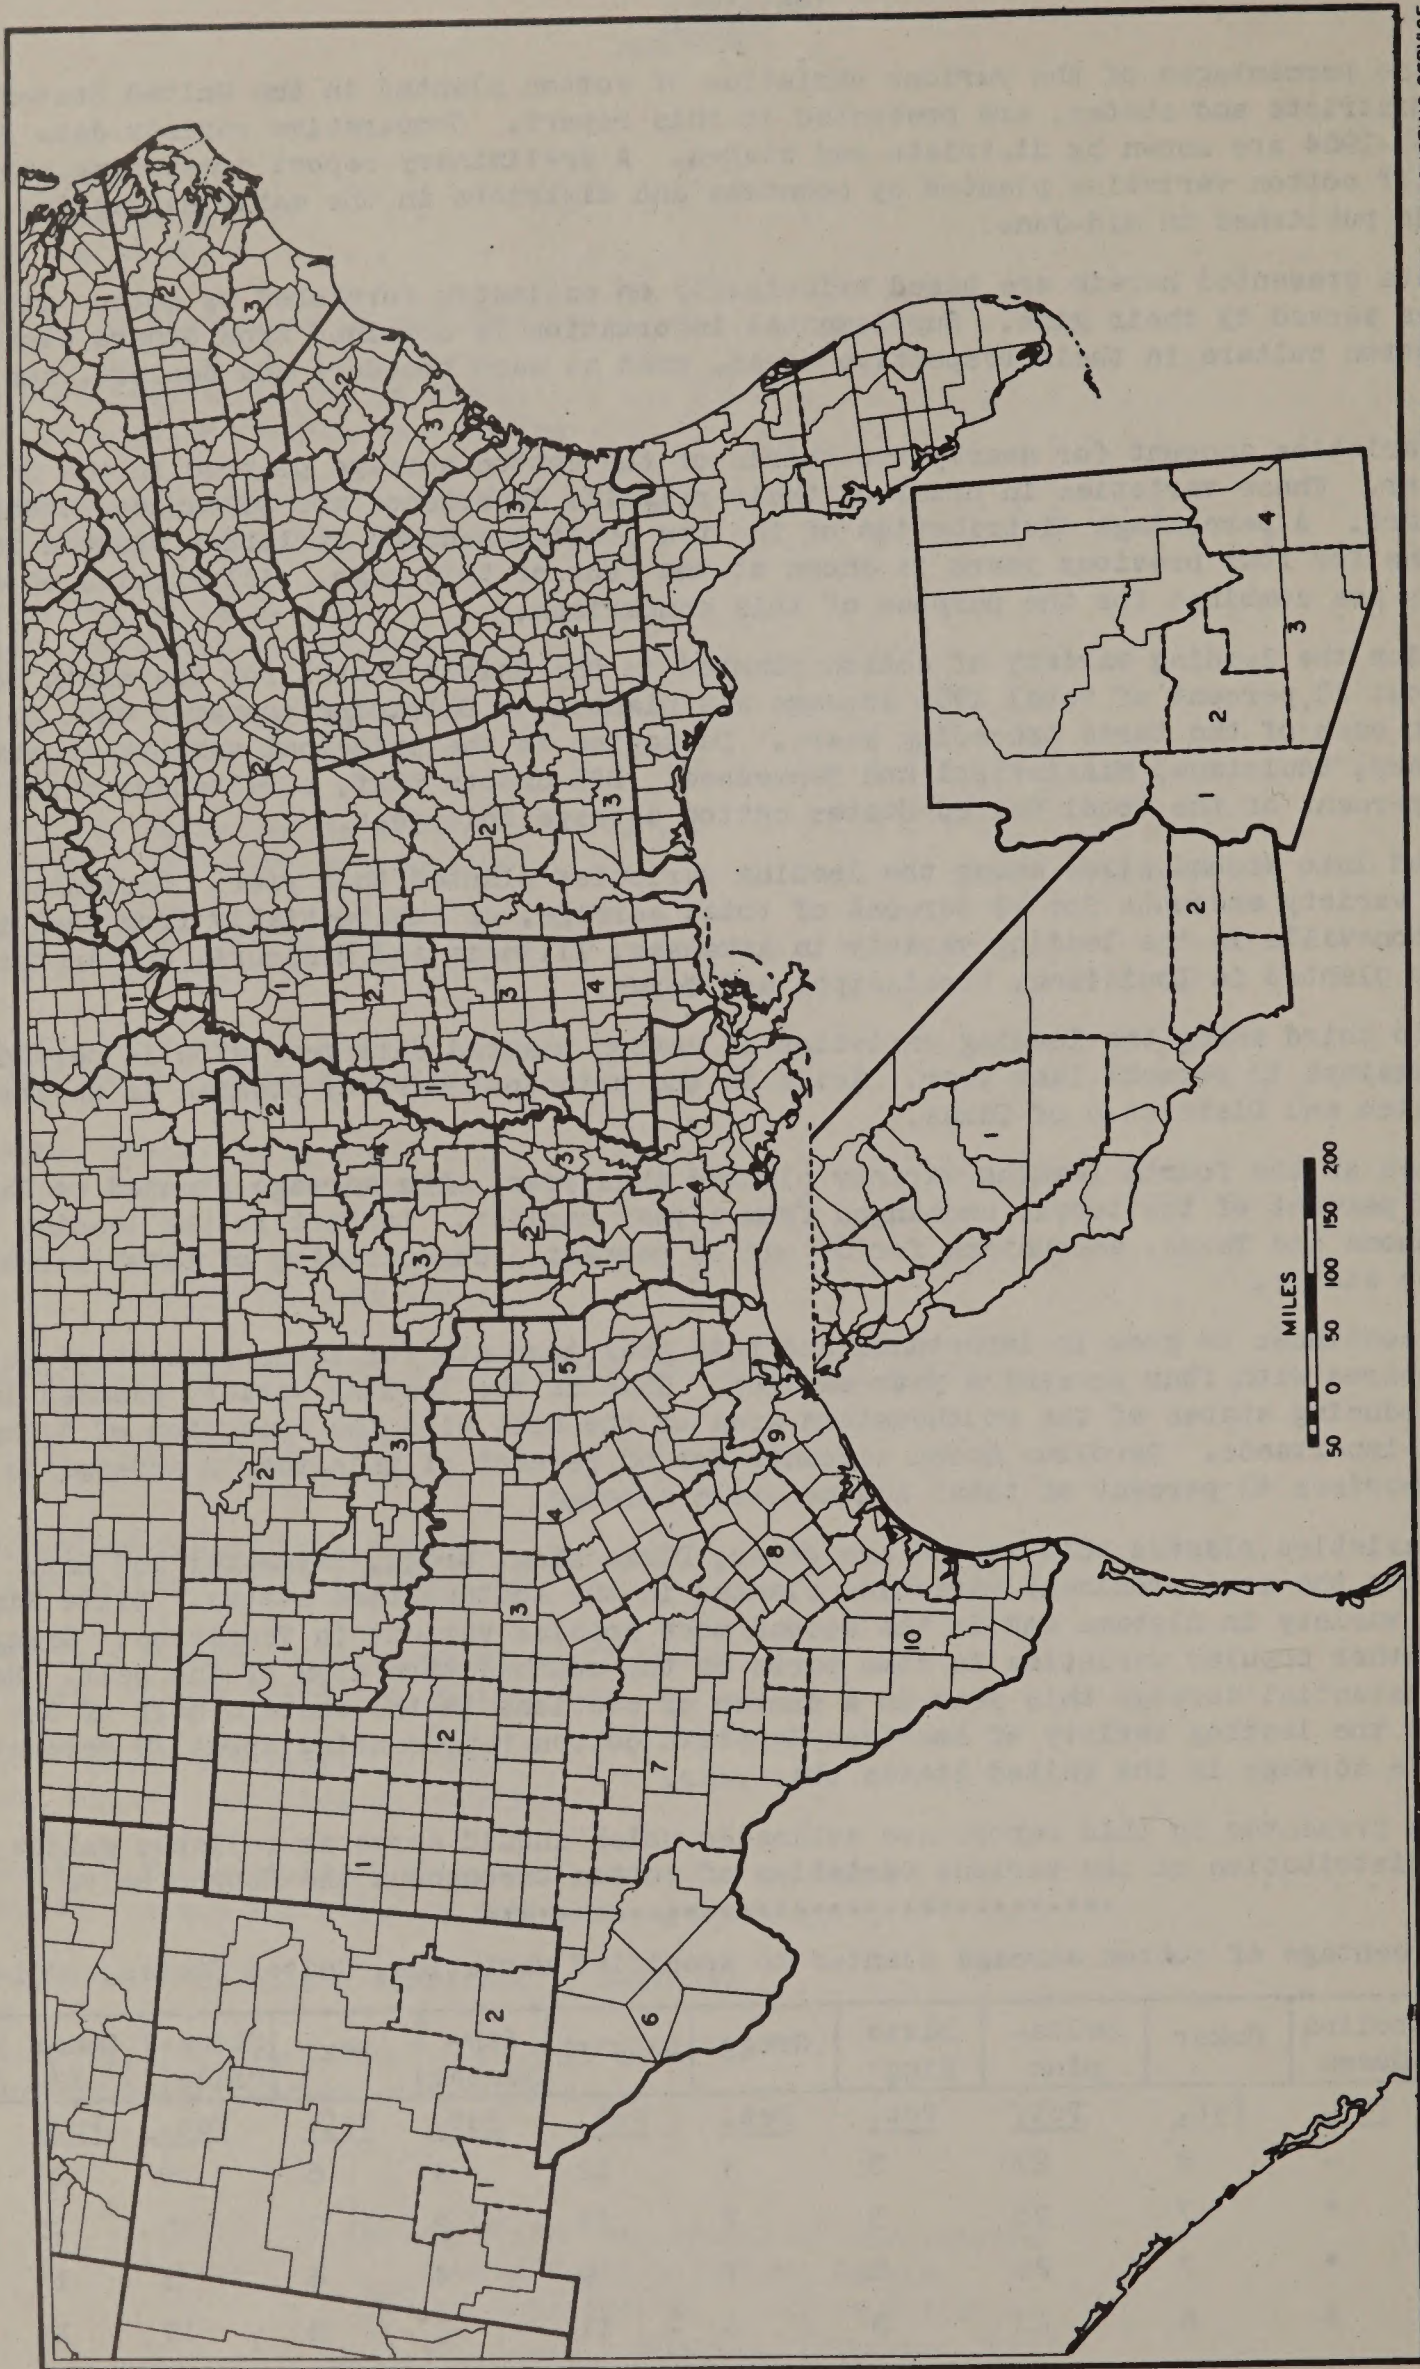

Estimated percentage of cotton acreage planted to specified varieties, United States, 1961-1965
